

1/2 **ULTI MATE**

Automated end to end laundry process, modular appliances that connect to a smart washing machine.

Solution

In order to make the whole laundering process much easier and less of a hassle we have to think about the entire process as a whole. The user only inserts the clothes in the dirty bins, sets the program from the central unit (directly or via app) and then the system washes, dries, folds and puts the clothes in the wardrobe. To make all of this possible, I've added a series of new features to conventional washing machines and dryers, such as detachable side panels and detachable washing drums that also become bins for dirty clothing + new emerging appliances like a folding machine and a steam ironing machine + a 2 axis elevator that connects them. Since all of them are modules, you can make your own setup according to your needs. It can be from the simplest system of washing machine + dryer + horizontal elevator that connects them to a complete system of:

washing machine + dryer, + folding machine + steam ironing + 2 axis elevator.

Washful Thinking

2/2
