Human body heat as source of power

The heat produced by the human body is converted into energy that runs our electronic devices.

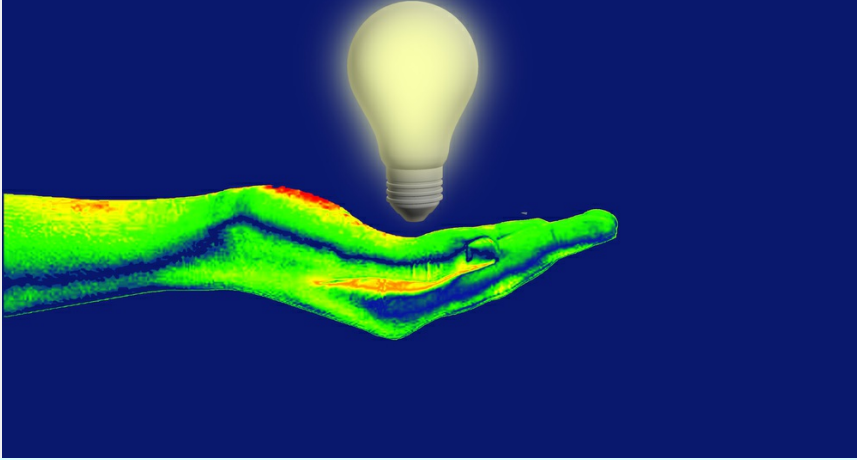

Observation

The human body can produce up to 2000 watts of energy when exercising – enough energy to power a PC if power were constantly provided at such a high level. However, as technology progresses batteries will become more efficient and electronic devices will require less energy in order to run. Thus, human body heat generated when the body is at rest could someday supply electronic devices with sufficient running power at a constant level - replacing conventional sources of energy.

Conclusion

Human body heat could someday provide electronic devices with alternative energy.

Human body heat as source of power

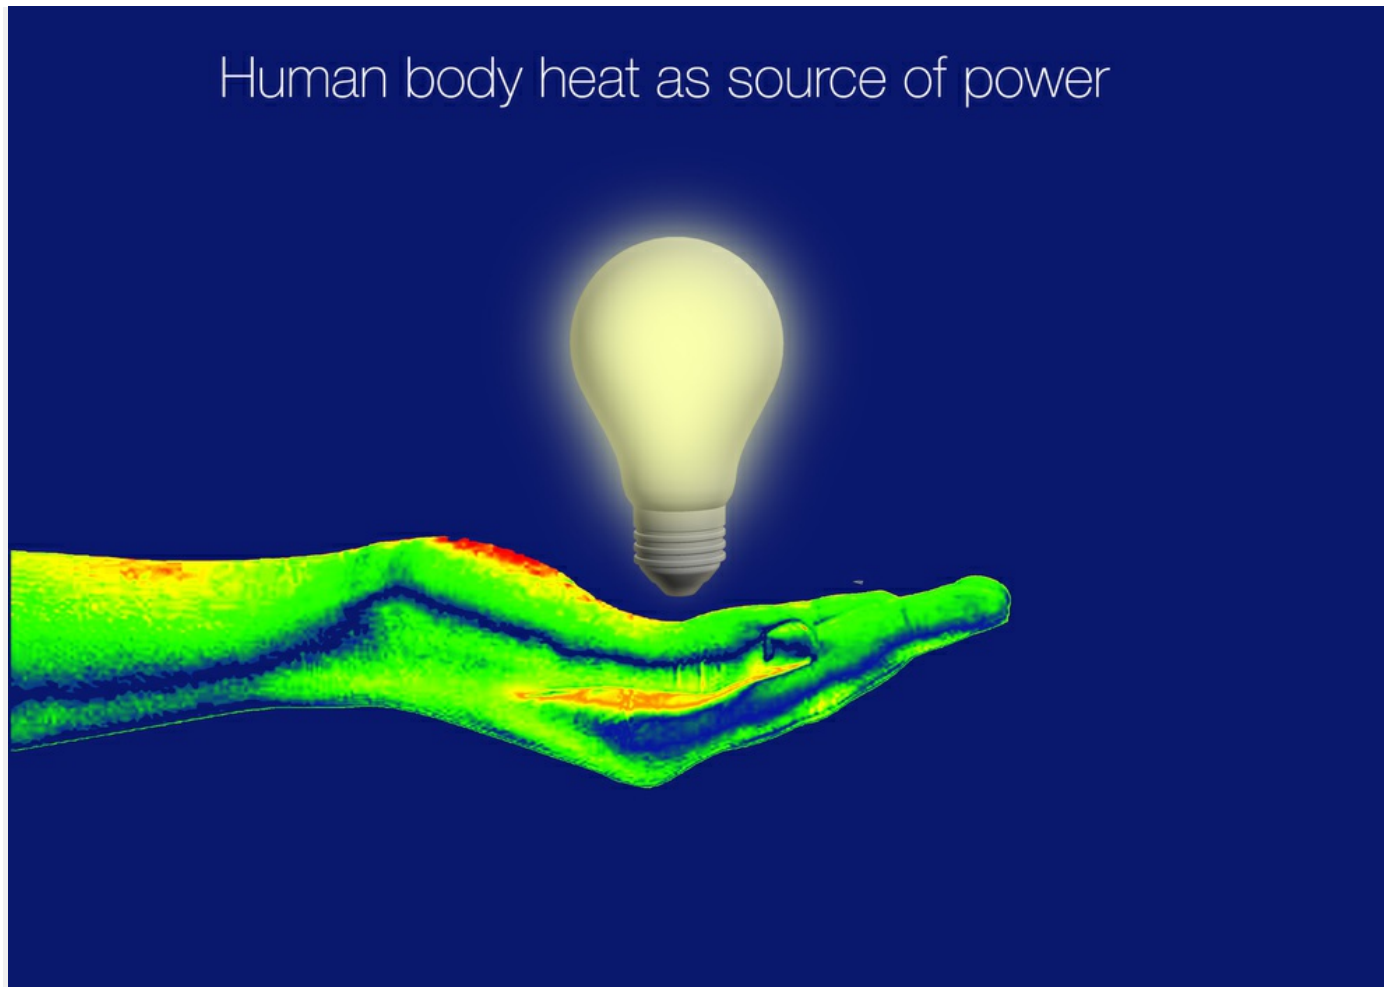

Solution

The idea at hand seeks to show creative ways by which human body heat provides electronic devices with running power in the near future.

2/3 **Human body heat as source of power**

The heat produced by the human body is converted into energy that runs our electronic devices.
