

1/2 Flight : Radar Series

Flight The Bag of The Future : Radar Series

Solution

Often time we experience sweatiness on our backs while wearing bag packs for a period of long time or perhaps in a harsh environment or condition such as running up ten floors to catch a lecture or walking from faculty to faculty etc, thus this cause us to sweat a lot & with our bag pack on ?

Therefore Flight is an ergonomically design bag pack to solve this problem by using a curve form to create air flow between our body & bag. Flight is also integrated with white LED for the sake of students that cycles home at night or evening. The stripe will be designed with a structured cushioning (not hard case) & the body will be design with strong recyclable plastic or perhaps aluminium (but afraid that aluminium will surely dent if drop hard). Within the hard casing bag

pack will be place a layer of thin cushioning to prevent stuff or things from knocking on each other or

Bag it!
